

Enhanced safety protocols

With over 70 years of experience and 50,000+ babies delivered, Repromed are leaders in reproductive care. We are passionate about helping patients achieve a family.

For those looking to proactively manage their reproductive health or simply wanting peace of mind about their future family options, we're here to support you and if there is a need for fertility treatment, we're here for that too.

For reassurance about the safeguards and procedures in our clinics and the care levels that Repromed provides, we have outlined the safety protocols embedded in our labs. These protocols have recently been strengthened even further and are now some of the most rigorous in the country.

Every Repromed embryo transfer includes:

- Enhanced prompted process for multiple scientists to independently verify the identity for both the patient and the selected embryo.
- An electronic witnessing system for added oversight and photographic evidence of traceability.
- Talking every patient through the exact details of the embryo selected right before the procedure.

The focus as always is, on getting it right, every time.

What technology is being used to enhance patient safety?

Matcher Electronic Witnessing

This is a barcode-based IVF electronic witnessing, labelling, scheduling, traceability and data insights system. It has been specifically created for fertility centres to help prevent errors through misidentification of patients and their gametes and embryos. All Repromed clinics are equipped with Matcher Electronic Witnessing.
